Architecting GWT applications for production at Google

Ray Ryan
19 May 2010

View live notes and ask questions about this session on Google Wave

<http://bit.ly/io2010-gwt8>

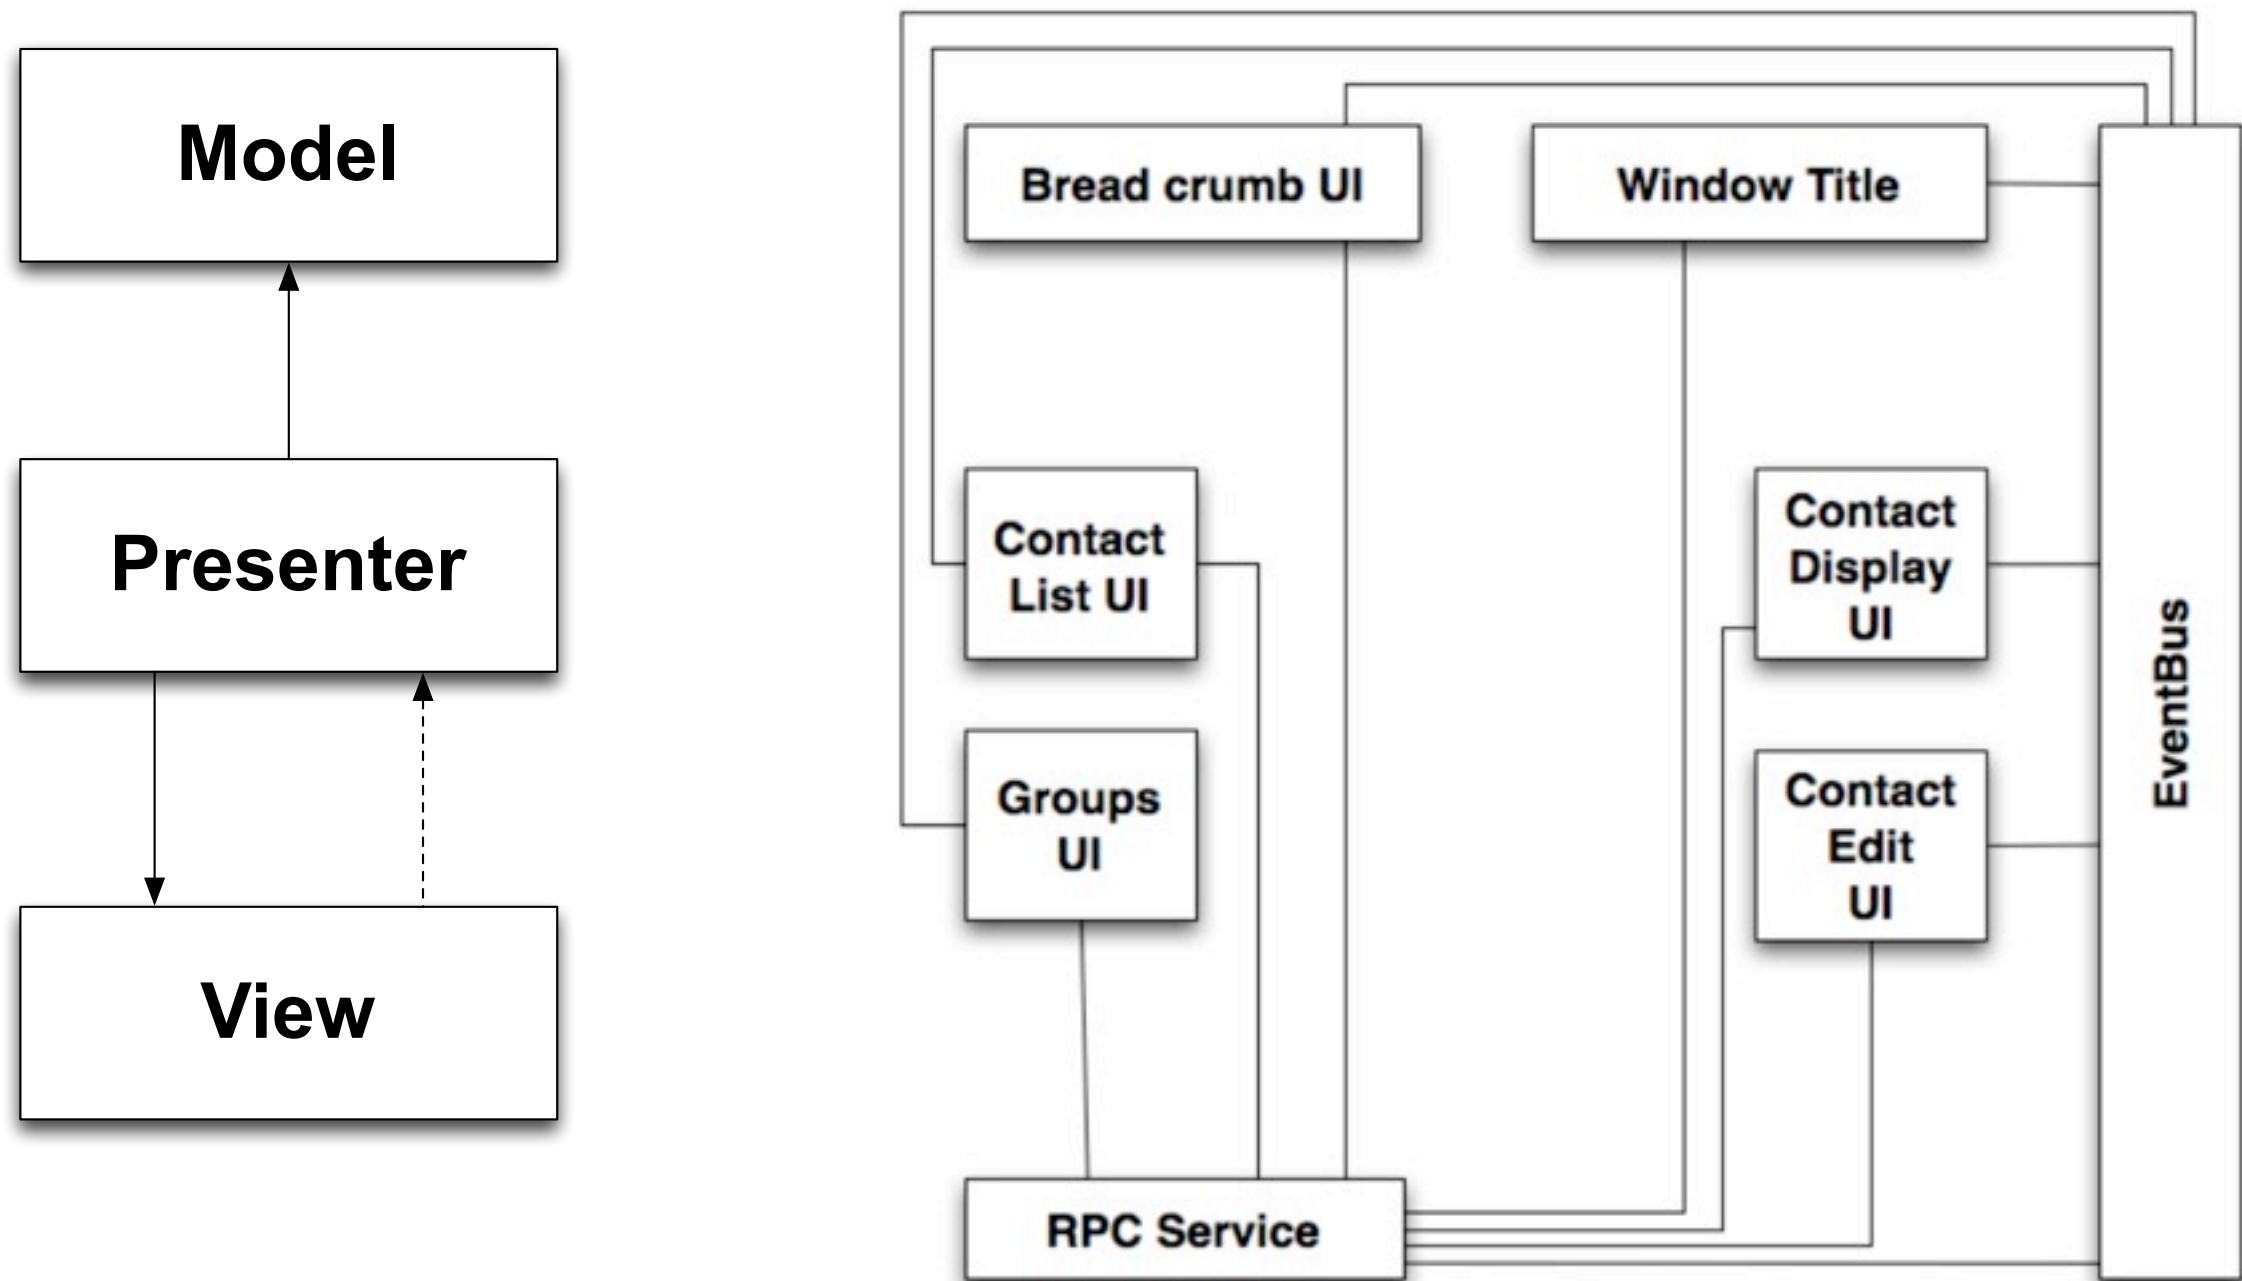

Answering two questions

- How does Google architect its web apps?
- How are GWT 2.1 and Spring Roo going to help me do the same?
 - `com.google.gwt.app`
 - `com.google.gwt.requestfactory`

If you like this talk, you'll love...

Building on last year's *Best Practices for Architecting*

Production Ready

“Production ready” means...

- Well tested
- Secure
- Monitored
 - What’s broke
 - What’s slow
- Scalable
 - Lots of users
 - Lots of developers
- Bookmark friendly
- Crawlable
- Localized

Isolation

- Well tested ✓
- Secure
- Monitored
 - What's broke
 - What's slow
- Scalable ✓
 - Lots of users ✓

GWT's UI overhaul

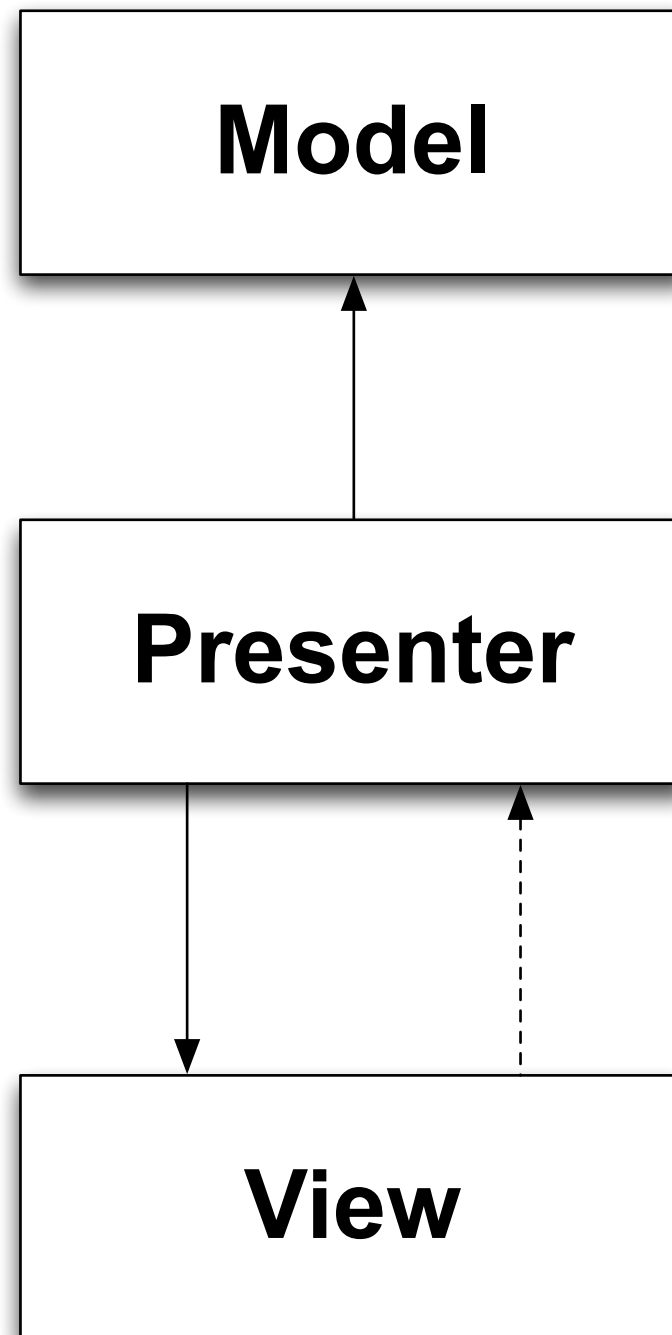

<http://bit.ly/io2010-gwt5>

Isolation

MVP

MVP

Effective Testing...

<http://bit.ly/io2010-gwt7>

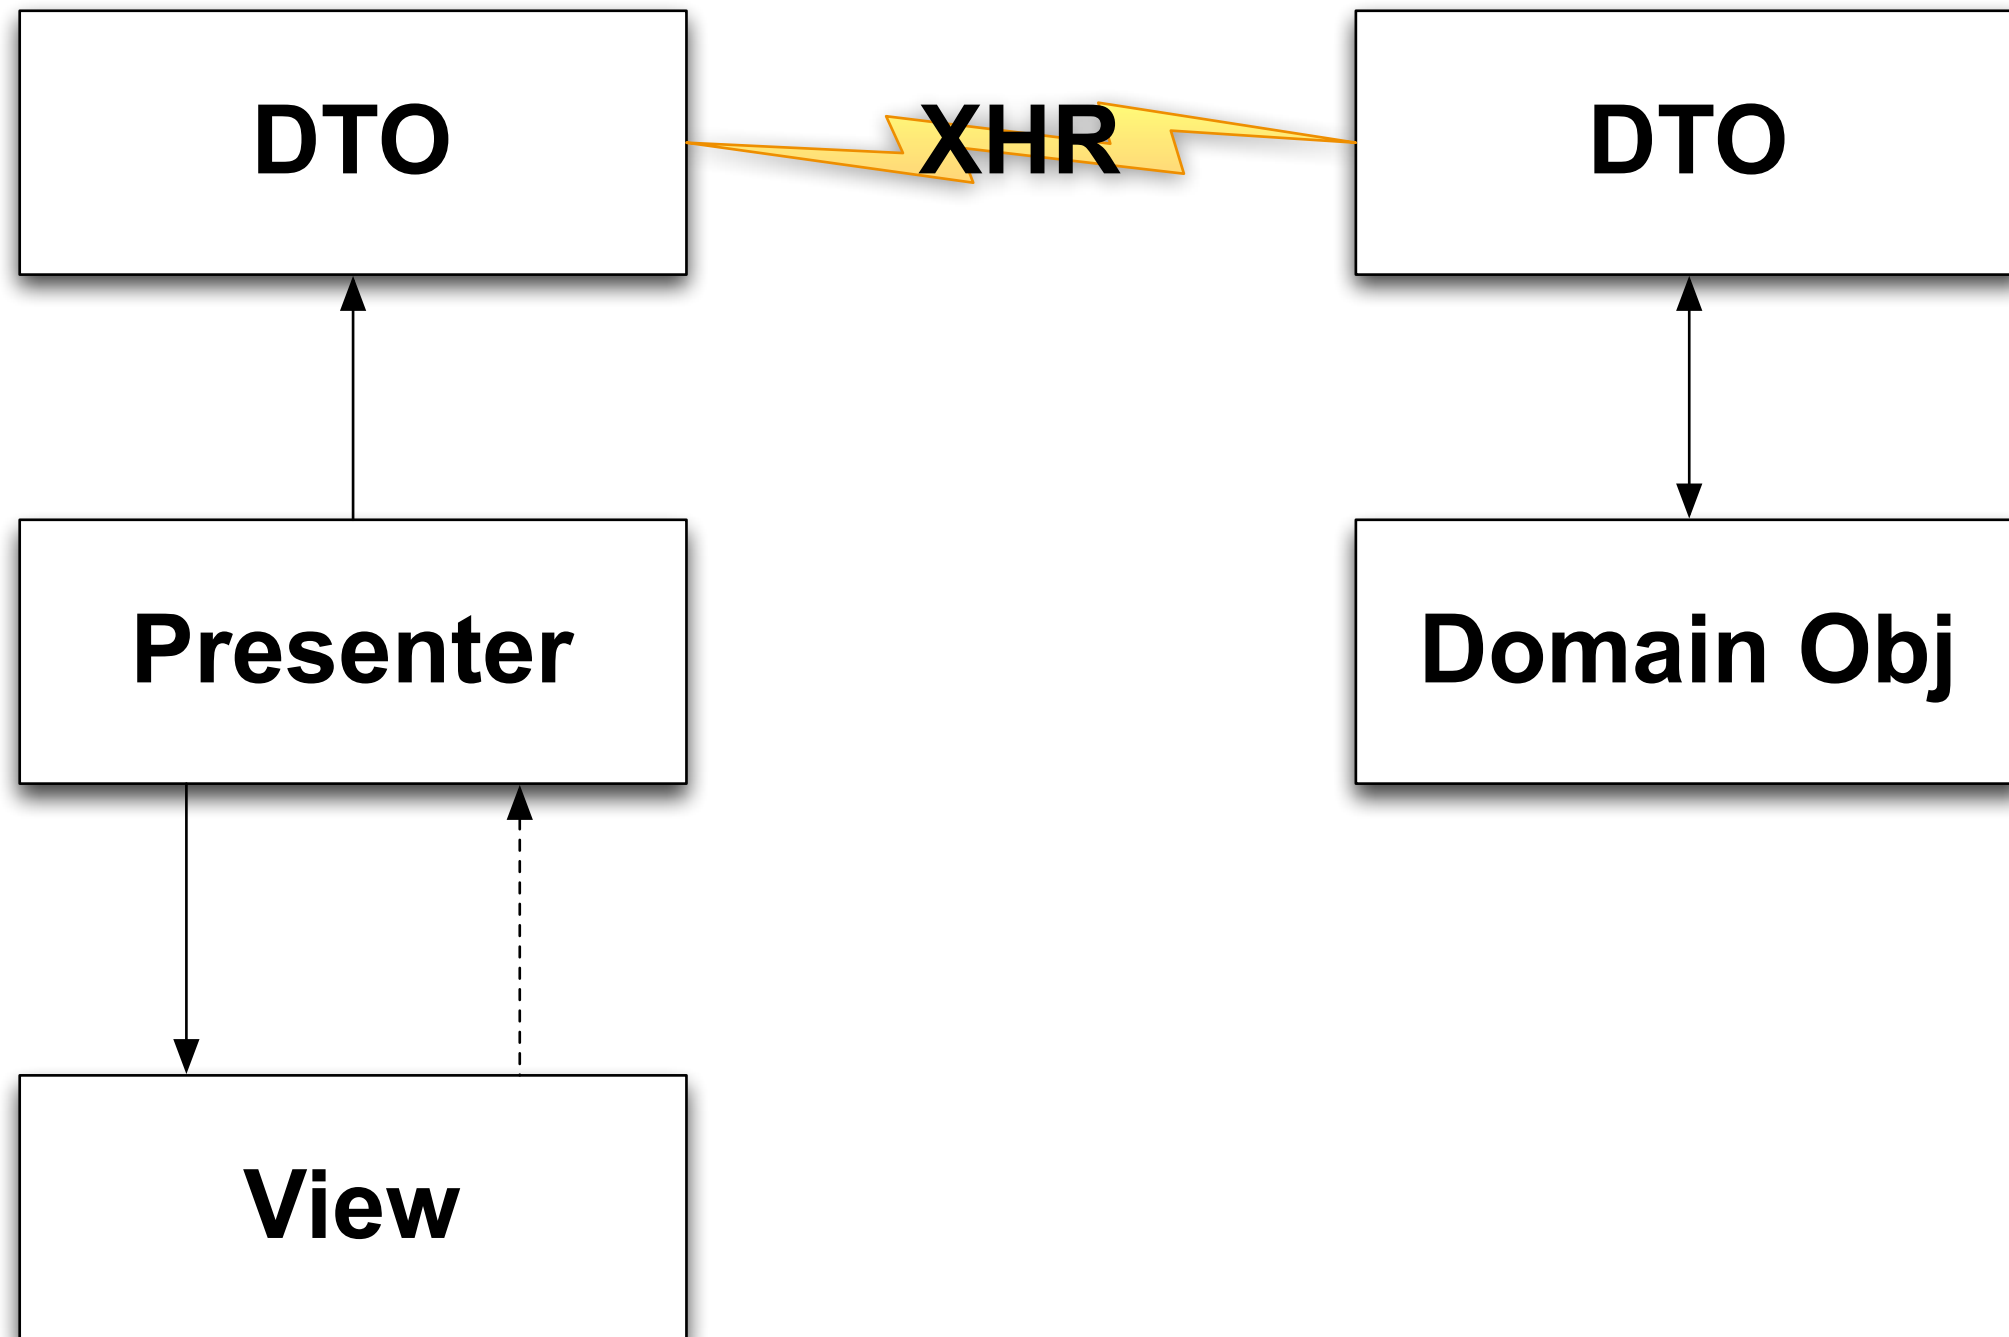

MVP

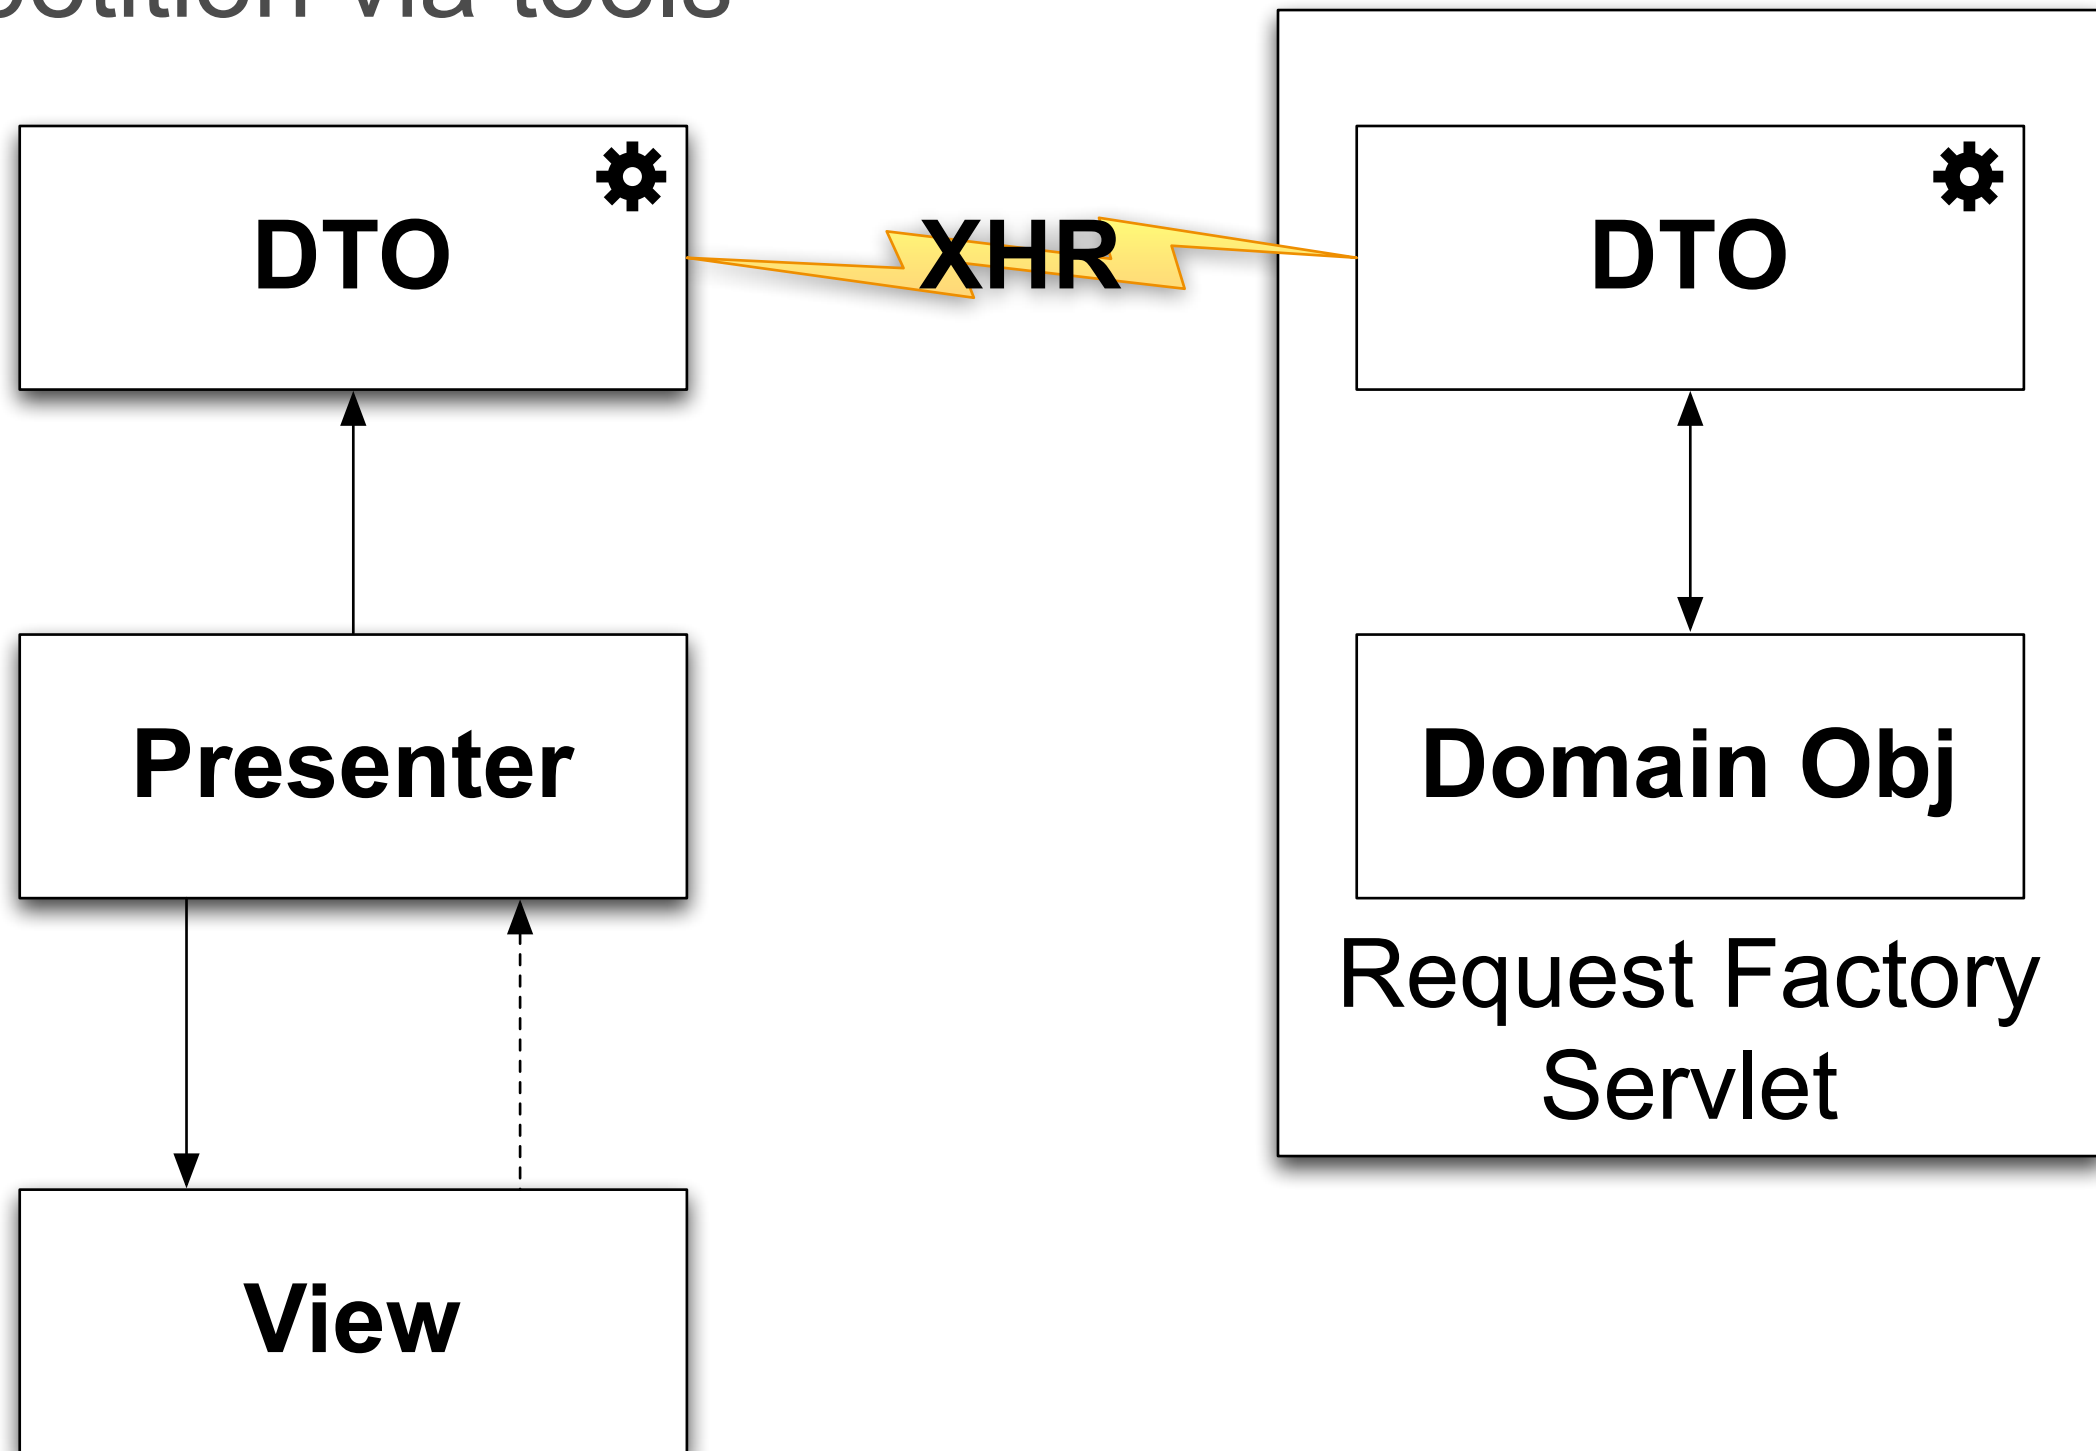

Effective Testing...

<http://bit.ly/io2010-gwt7>

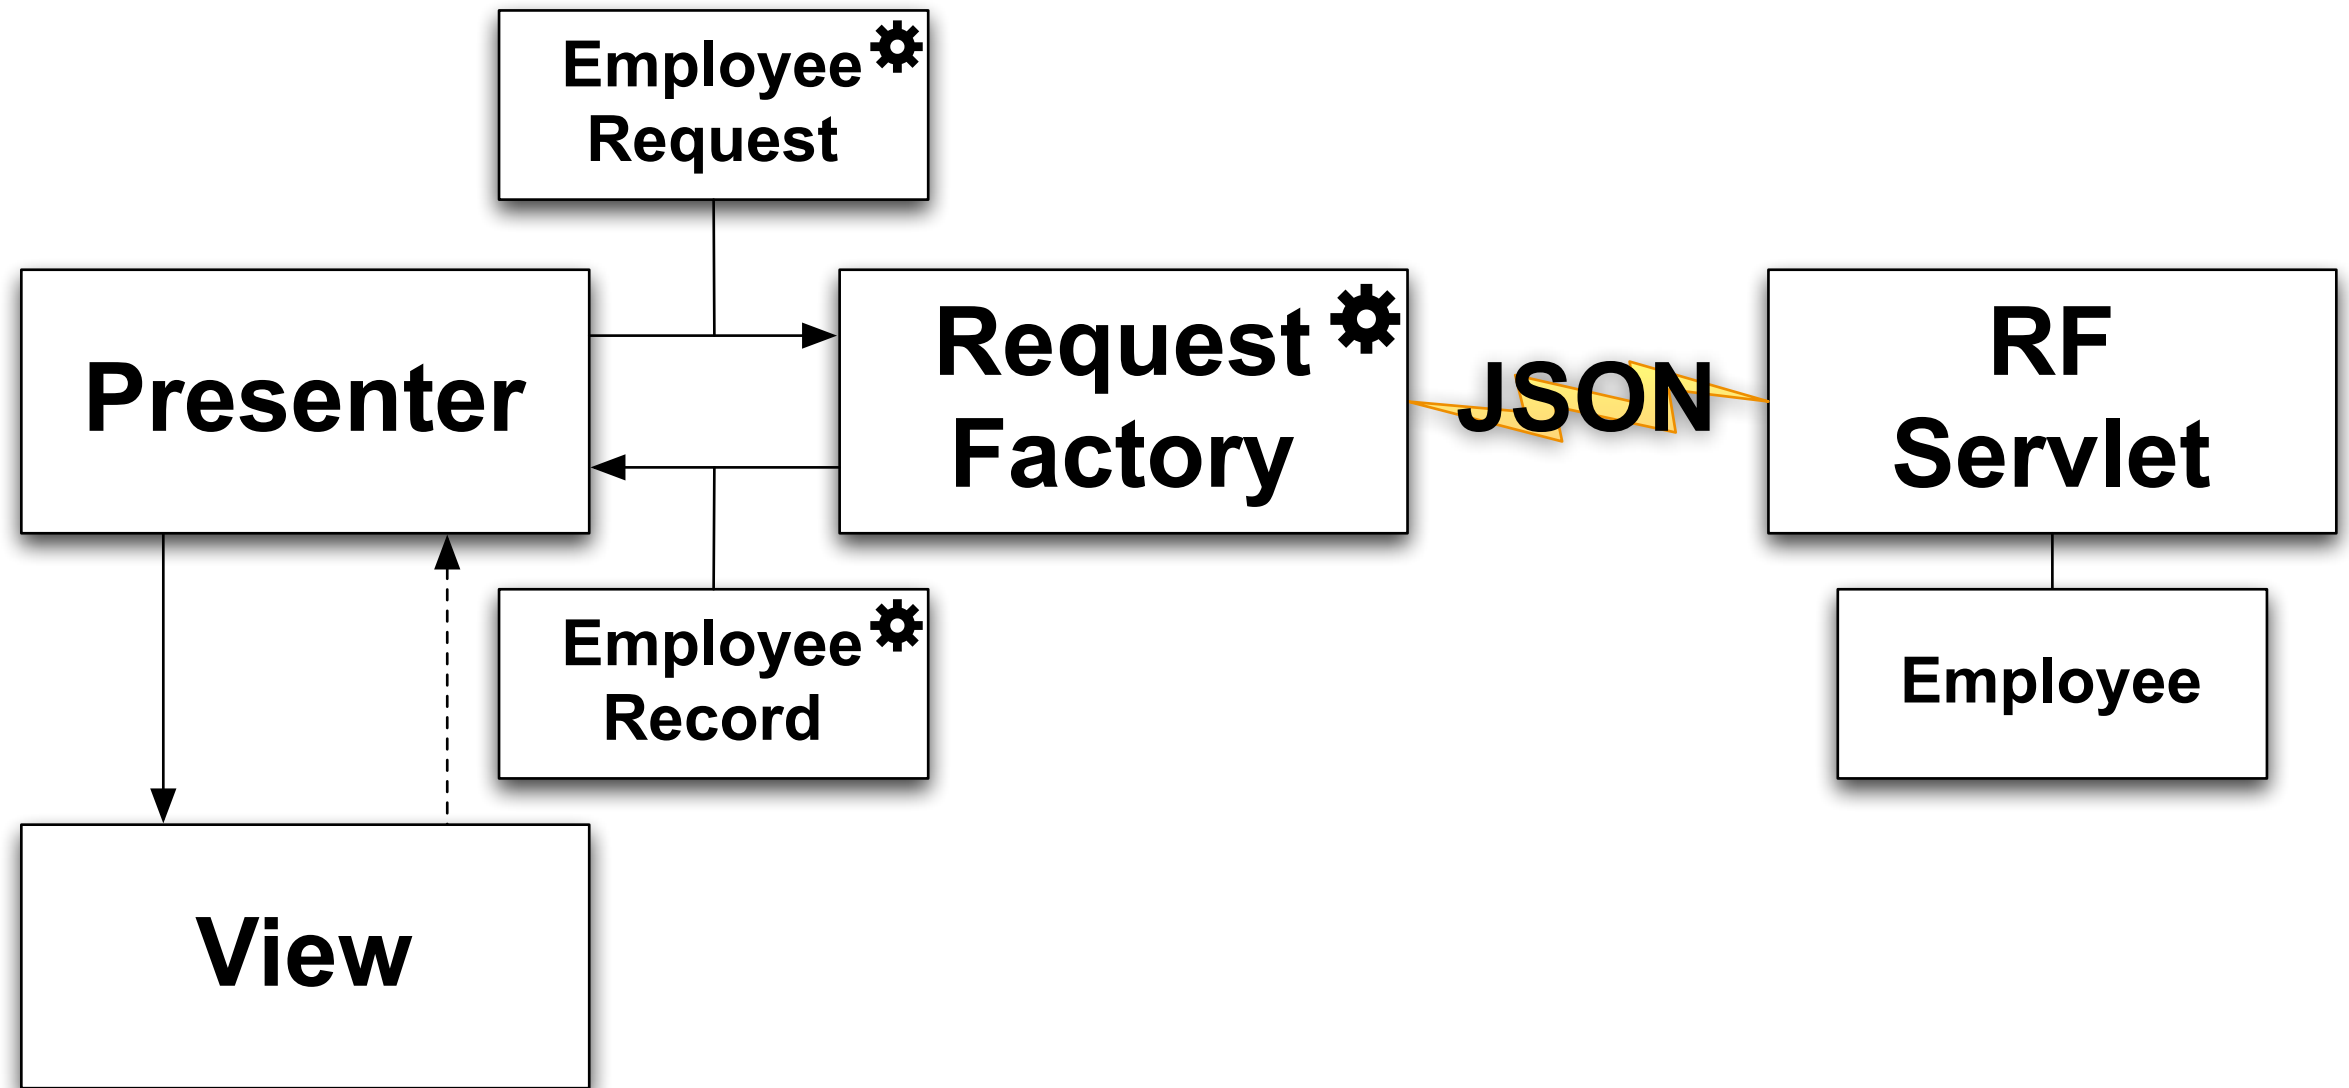

Waaah, DTOs violate DRY

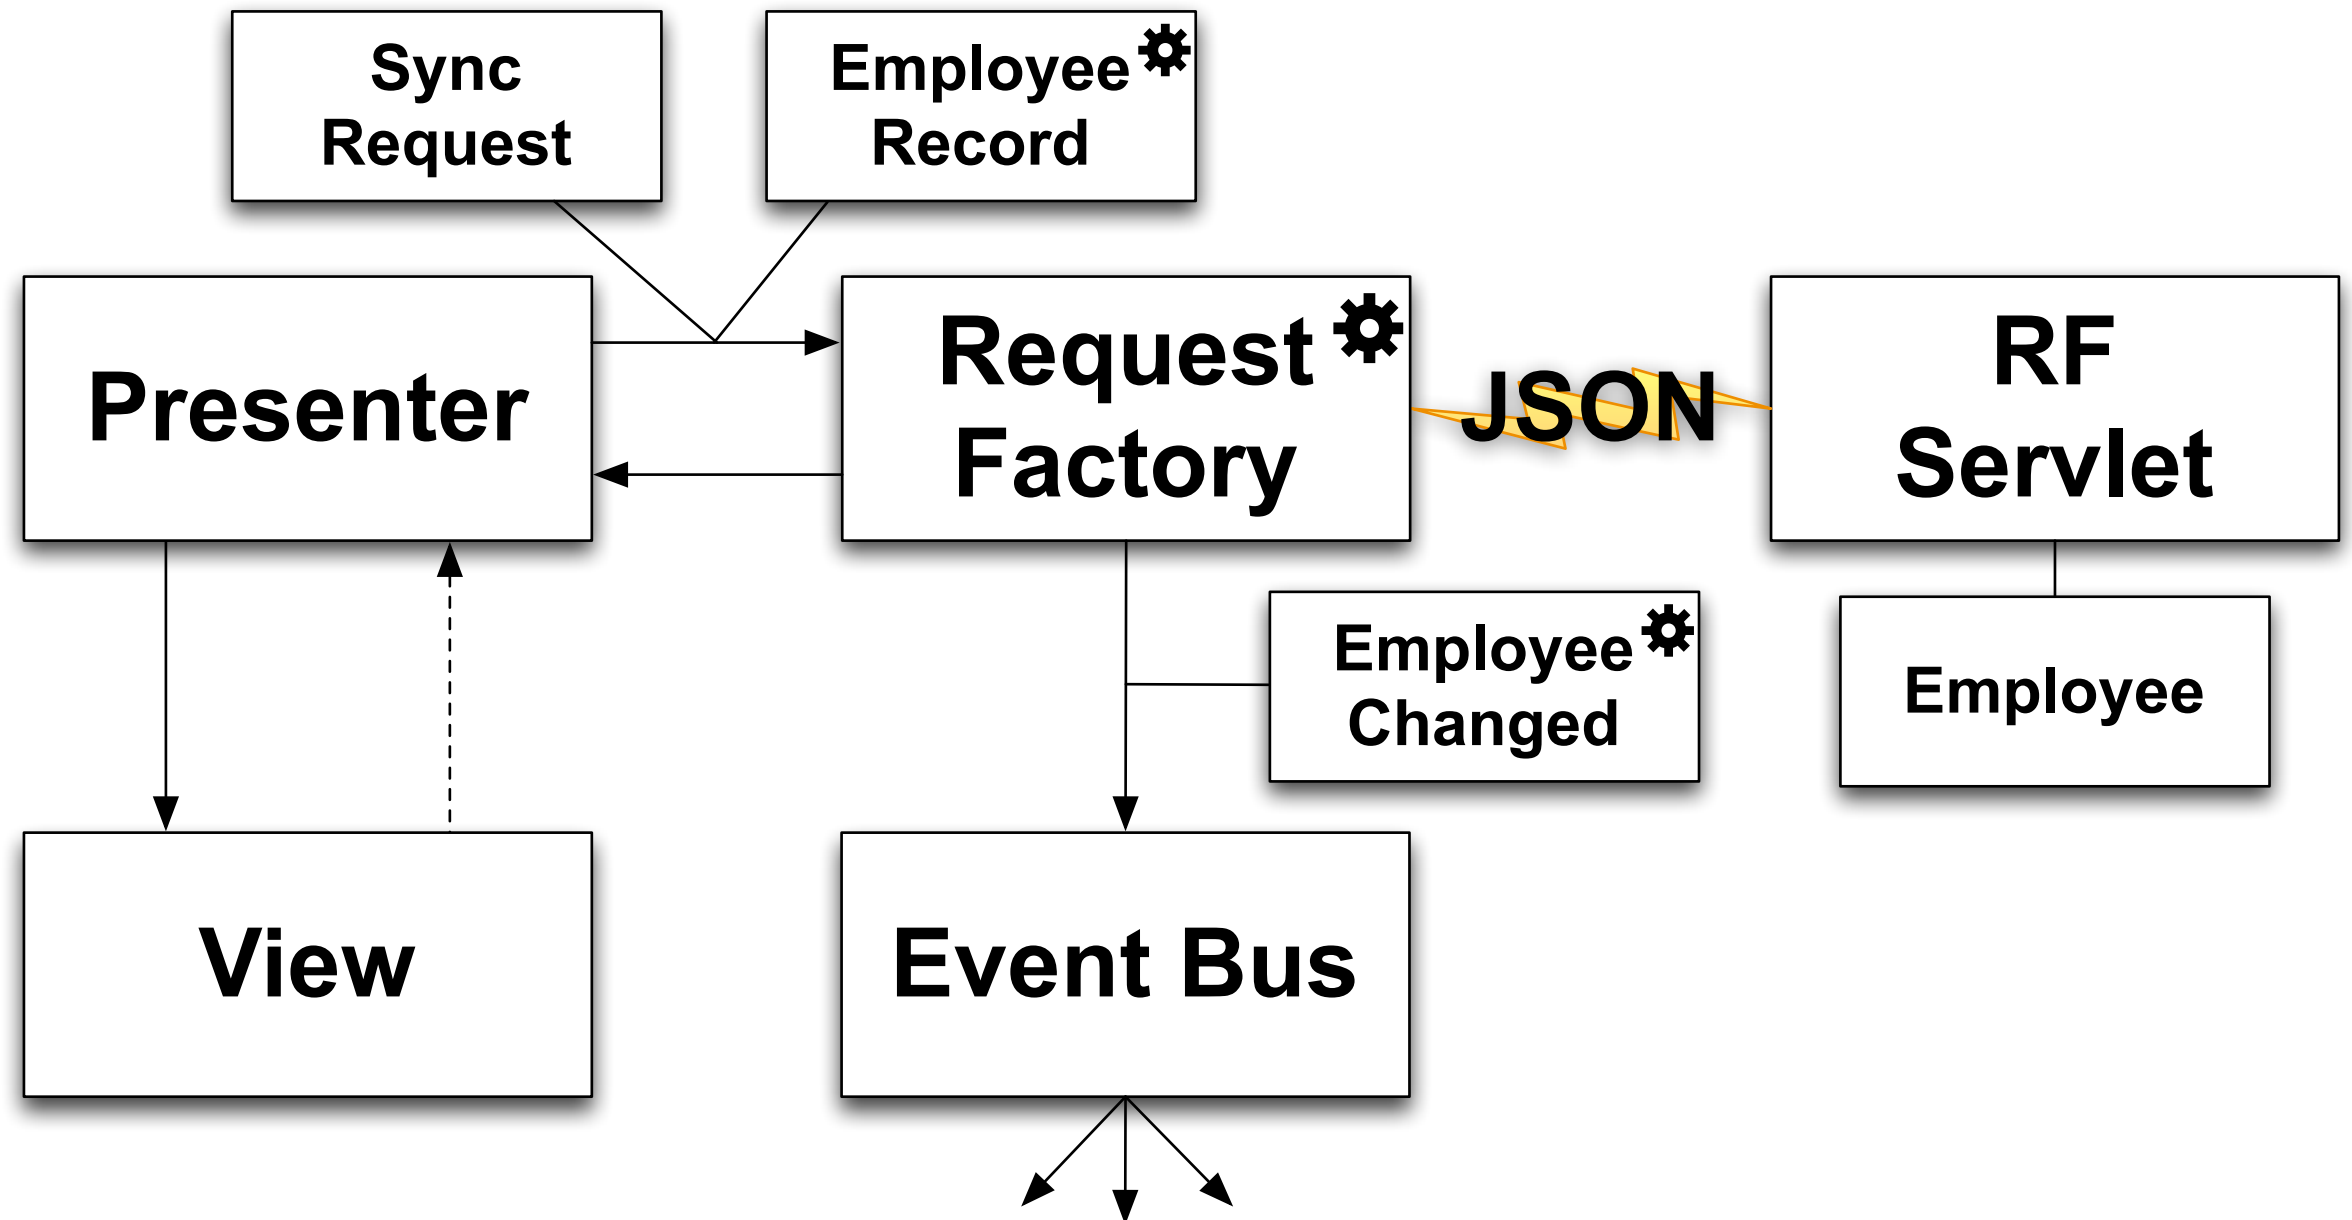

Repetition via tools

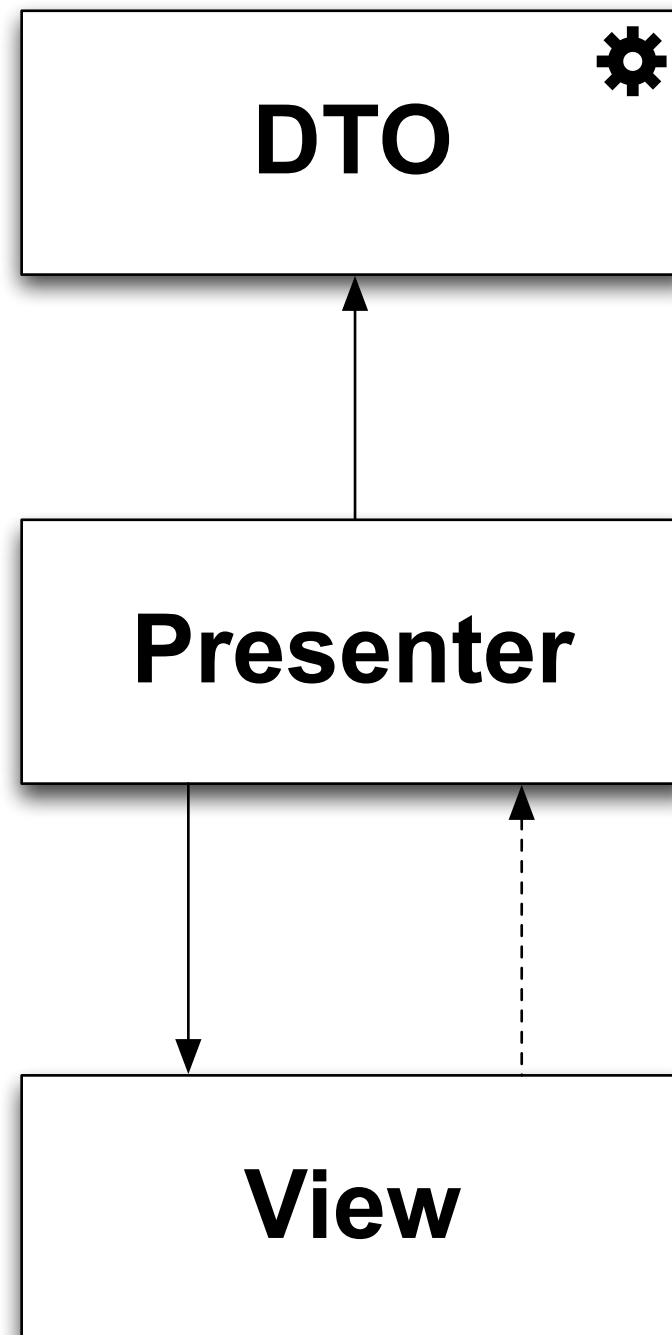

cRud

CrUD

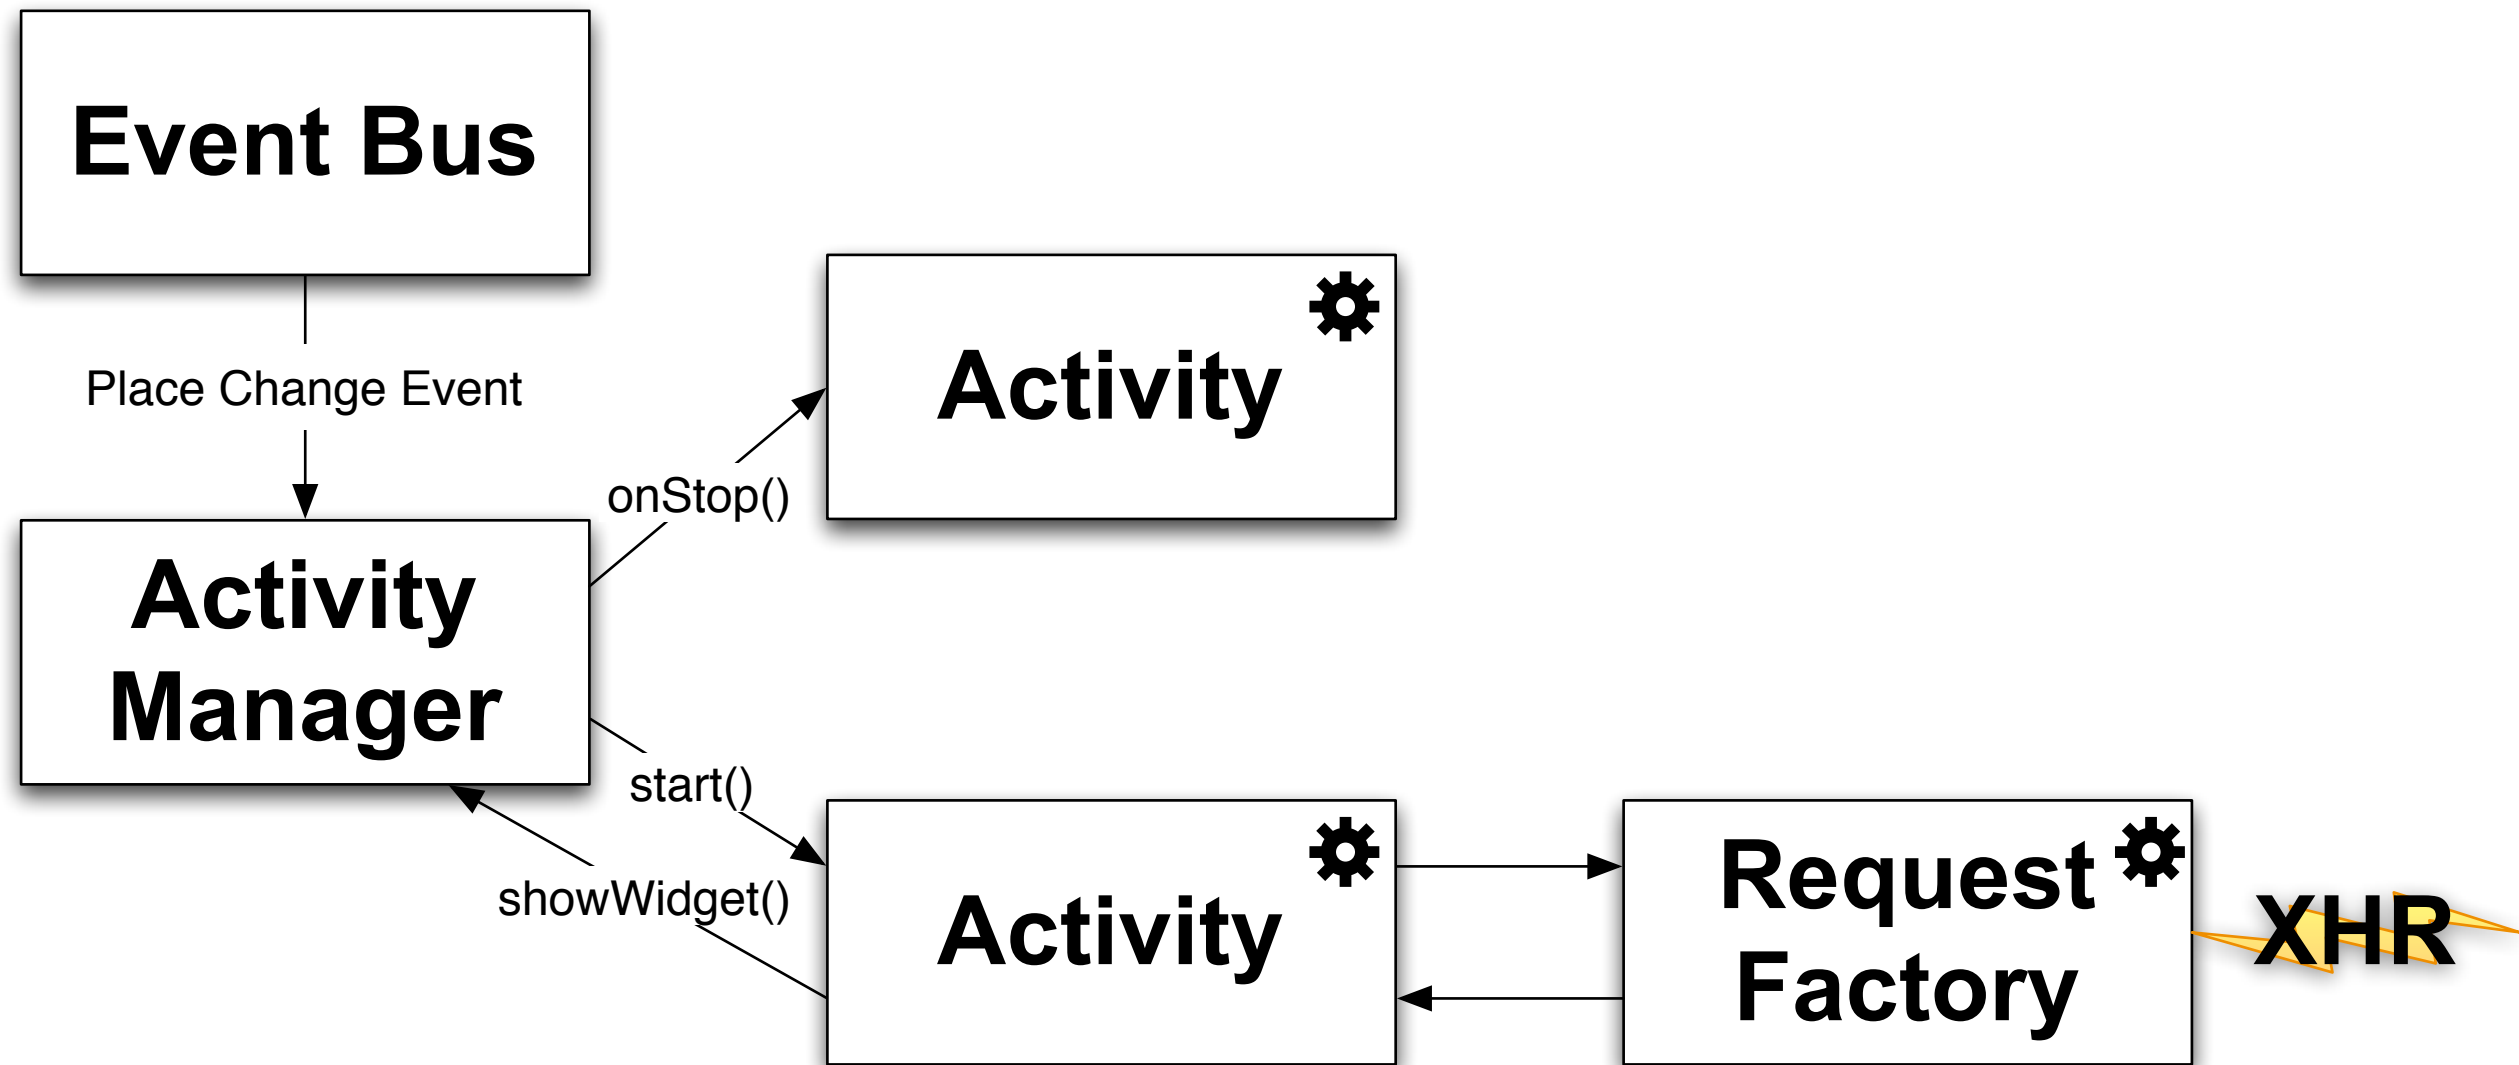

Waaah, presenter is too much boilerplate

Waaah, presenter is too much boilerplate

Activity life cycle

Activity in test

Isolated activity is crawlable activity

- Activity life cycle tied to history changes
- History changes tied to discrete URLs — bookmarkable
 - `http://example.com/#report:123456`
- Add a bang and a headless server — crawlable
 - `http://example.com/#!report:123456`
- <http://code.google.com/web/ajaxcrawling/docs/getting-started.html>

Waaah, too boring to test is too boring to write

Waaah, too boring to test is too boring to write

Selections of EditView<EmployeeRecord>

```
private static final EditorSupport SUPPORT =  
    GWT.create(EditorSupport.class);
```

```
@UiField TextBox displayName;  
@UiField TextBox userName;
```

```
public void setValue(EmployeeRecord value) {  
    this.record = value;  
    SUPPORT.setValue(this, value);  
}
```

```
public boolean isChanged() {  
    return SUPPORT.isChanged(this);  
}
```

All isolation promises kept but one

- Well tested ✓
- Secure
- Monitored
 - What's broke
 - What's slow
- Scalable ✓
 - Lots of users ✓
 - Lots of developers ✓
- Bookmark friendly ✓
- Crawlable ✓
- Localized

Give me convenience or give me scale

JPA--

No reference fields
(No joins)

Super portable

Super scalable

JPA for real

Anywhere but GAE

Scalable enough

Instrumentation

Your eyes on the browser

- Logging
- Stack traces
- User Actions

Logging: phone home

- Client side logger with remote logging service
 - <http://code.google.com/p/gwt-log/> today
 - `java.util.logging` in GWT 2.1 (no remote yet in 2.1 M1)
- Accumulate logs client side
- Watch for request batches and ride along, or flush on timer

Stack Traces

- Method level for free on most modern browsers
- Get it to the server
 - `HttpThrowableReporter` to send JSON formatted via XHR
 - In gwt-log, use `RemoteLoggerService`
- Re-symbolize obfuscated traces server side
 - <http://code.google.com/p/google-web-toolkit/wiki/WebModeExceptions>
 - Fair warning: that page is terse to the point of encryption

Emulated Stack Traces

- For line-level traces
 - and anything at all on less modern browsers

```
<set-property name="compiler.emulatedStack" value="true" />  
<set-property name="compiler.recordLineNumbers"  
  value="true" />
```

- But your app is fatter and slower

Emulated stack traces in production

Let your uses opt in

<http://www.example.com/?debug>

```
<define-property name="traces" values="true,false"/>
<property-provider name="traces"><[CDATA[
  return $wnd.location.query.contains('debug');
]]></property-provider>
<set-property name="compiler.emulatedStack" value="true" >
  <when-property-is name="traces" value="true" />
</set-property>
<set-property name="compiler.recordLineNumbers" value="true" >
  <when-property-is name="traces" value="true" />
</set-property>
```

User Actions

- Unique strings associated with each interesting UI element
 - links, buttons
 - maybe in ui.xml
- User gestures (clicks a link, say), user action event posted on event bus
 - Time is noted
 - rpc queued in this event loop attributed to this action
- When all rpcs return, time is tallied, logs trickle to server
- Planned for GWT 2.1 (but not in 2.1 M1)

Suspicion

Secure: guard against cross site scripting attacks

- RemoteServiceServlet watching for X-GWT-Permutation header for XSRF paranoia
 - New in GWT 2.1
 - Only XHR can set a header, and XHR is from your domain
- SafeHTML
 - Debuts as open source in new web-based Wave FedOne client
 - <http://code.google.com/p/wave-protocol/>
 - Destined for GWT 2.something

SafeHtml: because setHtml() isn't

- If the user typed it, you must not render it as HTML
 - prefer `HasText#setText` to `HasHTML#setHTML`
 - prefer `Element#setInnerText` to `#setInnerHTML`
- SafeHtml interface promises its `asString()` produces harmless HTML
- SafeHtmlBuilder and SimpleHtmlSanitizer
- for assembling untrusted strings into SafeHtml instances
- SafeHtml aware widgets that replace `setHTML()` with `setSafeHtml()`

Now say what you said

“Production ready” means...

- Well tested
- Secure
- Monitored
 - What’s broke
 - What’s slow
- Scalable
 - Lots of users
 - Lots of developers
- Bookmark friendly
- Crawlable

“Production ready” means...
